How to test for "Gas in the oil" on 4C Spica Pumps

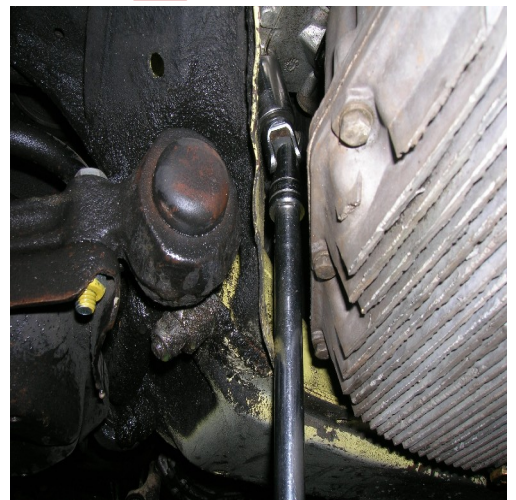

Use a long 1/2 drive extension with a "T" Handle, 1/2 drive universal adapter and a 22 mm socket.

The Universal is needed since it is not a straight line to reach the 22 mm nut under the injection pump.

Crack loose the nut then carefully catch any liquid that drains from the pump into a small cup. Most of the oil will have already drained back into the engine, so don't expect more than a couple of ounces.

If the liquid is very thin and smells bad the pump needs servicing. If the liquid burns like a candle there is gas in the oil.
